## keys g27

Geschrieben von Christian Dager - 28.11.2018 10:42

---

Hello,  
Surely already mentioned !!  
I would like to program extra keys on my G27 (rear view, headlights, brake distribution, limiter) But despite programming in Profiler, it does not work in gtl. I only have left / right view and some others ...  
what is the method ...?  
Thanks

Hi

you must configure the wheel-buttons in GTL.  
Open GTL, go to options, then to extras, (left button). click with mouse f.ex. on headlights, then click desired wheel-button.

greet hayman

Hi,

so you use the Logitech profiler to configure/calibrate your Steeringwheel/Pedals?

Option 1:

Do you use Lowguard? If you go to windows through alt+tab you must "touch" lowguard window before go to gtLegends again.

Option 2:

Ä Do you see the correct wheel picture in logitech profiler? Maybe a wrong instalation.

Option 3:

In GTL go to options/controller and click where says logitech g27 before start programing keys.

1 no, I do not use Lowgard

2 yes, it's the right wheel

3 Yes it's done

I even test with JoytoKey, does not work either!

I actually use g27 keys as keyboard keys, but configured in profiler, without external software.  
(picture: <https://imgur.com/hww4oaj> )

Does it works with any other simulator?

Have you tried uninstalling and reinstalling profiler? (reboot x2) probably its 3 minutes and could be an easy solution.

Did you make a profil for GTL in logitech profiler?

See picture from AGM....."Jugar GTL"

yes, that's what I'm trying to do ...

With the other simulators the keys are all recognized without going through the profiler.

I will try by uninstalling.

I did not want it, the last time it was always capricious to install it ...!

Hi,

I cannot see the picture from AGM - but I used a G27 long time. The profiler did work but sometimes he lost the config. So I used the xpadding and this tool worked till I changed my wheel. Search for xpadding I think you will find a free version until you pay 7,99 for the actual version. Its more flexibel and stable as the profiler.

rdjango

Edit means to AGM: so the profiler is not needed with xpadding - and I edited the size of your (not visible) picture to 400 so we can read the whole text better - no overlapping in this page-layout - hope you agree ;)

ty Rdjango.

Dauger, do you start GTL in administrator mode?...
